## Description

## FIELD OF THE INVENTION

[0001] The present invention relates to new acyl-piperazinyl-pyrimidines of the general formula (I), to their physiologically acceptable salts, to procedures for their preparation, to their application as medicaments in therapy for humans and/or as veterinary medicaments and to the pharmaceutical compositions which contain said compounds.

[0002] The new compounds object of the present invention can be used in the pharmaceutical industry as intermediates and for the preparation of medicaments.

## BACKGROUND OF THE INVENTION

[0003] In our patents EP 382 637 and EP 497 659 we have described different derivatives of alkyl-piperazinyl-pyrimidines of the general formula (II) with ansiolytic and or tranquillising properties.

[0004] We have now discovered that the addition of a substituent to position 4 of the pyrimidine and the substitution of an alkyl radical with an acyl radical gives rise to the new compounds of general formula (I). Said compounds show useful biological properties which makes them especially useful for their use in therapy in humans and veterinary therapy. The compounds of the present invention are useful as agents which act on the central nervous system in mammals including humans. In particular, the new compounds are useful as sedatives, anti-convulsants, sleep-inducing agents and general anaesthetics.

## BRIEF DESCRIPTION OF THE FIGURES

[0005]

Figure 1 shows the results of the sedative activity of some of the compounds of the invention, as determined by reduction in locomotive activity.

## DETAILED DESCRIPTION OF THE INVENTION

[0006] The present invention provides new compounds capable of inducing conscious sedation, of acting as sleep-inducing agents, anti-convulsants, analgesics, muscular relaxants, anti-tussigenics, ansiolytics, anti-psychotics, anti-depressants, anti-cerebral ischaemics, anti-migraine agents, agents useful for sleep disorders, agents for neurodegenerative diseases, agents for cognitive disorders and Alzheimer's disease, and agents capable of inducing or maintaining general anaesthesia, when administered by an appropriate method at a suitable dosage level.

[0007] The compounds of the present invention are represented by the general formula (I)

**[0016]** The new compounds of general formula (I) may contain an asymmetric carbon atom and can therefore be prepared as optical isomers or racemates. The racemates of compounds (I) can be resolved into their optical isomers using conventional methods, such as separation by chiral chromatography or fractionated crystallisation from their diastereoisomer salts for example. Similarly, they can also be obtained from asymmetric synthesis using chiral precursors.

**[0017]** The present invention also relates to physiologically acceptable salts of the compounds of general formula (I), in particular addition salts of mineral acids such as hydrochloric acid, hydrobromic acid, phosphoric acid, sulphuric acid, nitric acid and addition salts of organic acids such as *p*-toluensulphonic acid or methansulphonic acid.

**[0018]** The new derivatives of general formula (I), in which X is an atom of oxygen and R<sub>1</sub> and R<sub>2</sub> have the hereinbefore defined meaning, can be prepared according to methods A or B which are described below.

#### METHOD A:

**[0019]** The compounds of general formula (I) can be prepared by reacting the derivative of chloropyrimidine (III), where R<sub>1</sub> has the hereinbefore defined meaning, with a derivative of piperazine of general formula (IV) in which X and R<sub>2</sub> have the hereinbefore defined meaning.

**[0020]** The reaction is carried out in an organic solvent, for example in an chlorinated hydrocarbon such as dichloromethane or chloroform, a linear or cyclic ether such as 1,2-dimethoxyethane, tetrahydrofurane or dioxane, a aprotic polar solvent such as pyridine, dimethylsulphoxide or dimethylformamide or any other type of solvent appropriate for carry out a aromatic nucleophilic substitution reaction. The reaction can be carried out in the presence of a mineral or organic base such as an aliphatic amine, preferably triethylamine or *N*-methylmorphine by stirring at a temperature lying between room temperature and the boiling point of the solvent for a period of time lying between ten minutes and twenty-four hours, the preferring conditions being a period of time between thirty minutes and five hours.

#### METHOD B:

**[0021]** By reaction of the amine of formula (V):

in which  $R_1$  has the hereinbefore defined meaning with a carboxylic acid of the general formula  $R_2\text{COOH}$  (VI), in which  $R_2$  has the hereinbefore defined meaning, or with a salt of said acid or also with a derivative reagent  $R_2\text{COY}$  (VII).

15 [0022] Examples of salts include salts of alkali metals such as sodium salts and potassium salts, alkaline earth salts such as calcium salts and magnesium salts, ammonium salts, and salts of organic bases such as triethylamine, trimethylamine, pyridine and picoline.

20 [0023] Examples of derivative reagents of general formula  $R_2\text{COY}$  (VII) in which Y is a halogen atom preferably a chlorine atom or a bromine atom, an azide group ( $-\text{N}_3$ ), a 1-imidazolyl, a  $\text{O}-\text{CO}-\text{R}_4$ , in which  $\text{R}_4$  can be an alkyl or aryl radical of 1 to 6 carbon atoms, preferably substituted with one or several halogen atoms, or a group  $\text{OR}_5$  where  $\text{R}_5$  represents an aromatic group of one or two rings substituted with one or several halogen atoms or nitro radicals, the preferred groups being 4-nitrophenyl, 2,4-dinitrophenyl, pentachlorophenyl, pentafluorophenyl, 1-benzotriazolyl or N-succinimide. Similarly, instead of using the aforementioned derivative reagents, compounds of general formula (I) can be prepared directly by reaction of the amine (V) with the carboxylic acid or general formula (VI). In this case it is preferable that the reaction proceeds in the presence of reagents that activate the carbonyl groups such as N,N'-dicyclohexylcarbodiimide, diisopropylcarbodiimide or 3-(3-dimethylamino)propyl-1-ethylcarbodiimide. This reaction can also be carried out using the said carbodiimides in the presence of 1-benzotriazol or N-hydroxysuccinimide. The acids of general formula (VI) and the amine of formula (V) also react directly in the presence of N,N'-carbonyldiimidazol or of propanophosphonic acid anhydride.

30 [0024] The reaction is carried out in an organic solvent, for example in an chlorinated hydrocarbon such as dichloromethane or chloroform, a linear or cyclic ether such as 1,2-dimethoxyethane, tetrahydrofuran or dioxane, a aprotic polar solvent such as pyridine, dimethylsulphoxide or dimethylformamide or any other type of solvent appropriate for carry out a aromatic nucleophilic substitution reaction. The reaction can be carried out in the presence of a mineral or organic base such as an aliphatic amine, preferably triethylamine or N-methylmorphine by stirring at a temperature lying between room temperature and the boiling point of the solvent for a period of time lying between ten minutes and twenty-four hours, the preferring conditions being a period of time between thirty minutes and five hours.

#### METHOD C

40 [0025] The new derivatives of general formula (I), in which X is an atom of sulphur and  $R_1$  and  $R_2$  have the hereinbefore defined meaning, can be prepared according to the following method.

45 [0026] By treating a compound of a compound of general formula (I), in which  $R_1$  and  $R_2$  have the hereinbefore defined meaning and in which X is an atom of oxygen, with Lawesson's reagent (2,4-bis(4-methoxyphenyl)-1,3,2,4-dithiadiphosphaethano-2,4-disulphuro) or with phosphorous pentasulphide, the corresponding thioamides are obtained in which X is a sulphur atom:

[0027] The reaction is carried out in an organic solvent such as toluene, benzene, heptane, pyridine or tetrahydrofuran. The reaction is continually shaken at a temperature lying between room temperature and the boiling point of the

solvent for a period of time of between one hour and twenty-four hours, preferably carrying out the reaction at 80°C for a time between one hour and sixteen hours.

#### METHOD D:

5

[0028] The salts of the compounds of general formula (I) can be prepared by reaction with a mineral acid such as hydrochloric acid, hydrobromic acid, phosphoric acid, sulphuric acid, nitric acid or with an organic acid such as *p*-toluenesulphonic acid or methansulphonic acid in an appropriate solvent such as methanol, ethanol, ethyl ether, ethyl acetate, acetonitrile or acetone, being obtained with the normal precipitation techniques or crystallisation of the corresponding salts.

10

[0029] The invention provides pharmaceutical compositions which comprise, as well as a pharmaceutically acceptable excipient, at least one compound of general formula (I) or one of their physiologically acceptable salts. The invention also relates to the use of a compound of general formula (I) and their physiologically acceptable salts in the elaboration of a medicament with activity in the mammalian, central nervous system, including activity in the human central nervous system in particular, in the manufacture of a medicament with sedative, anticonvulsive, sleep-inducing and general anaesthetic activity.

15

[0030] In the examples which follow the preparation of new compounds according to the invention is indicated. Also described are some typical forms of use for the different fields of application, as well as medicinal formulas applicable to the compounds of the invention.

Sleep-inducing activity in mice

[0040] The sleep-inducing activity of the products of the present invention have been studied, evaluating the their capacity to increase the sleep time induced by barbital, according to a modification of the method described by David Sudgen (*J. Pharmacol. Exp. Ther.*, **1983**, 227, 3).

[0041] Fifteen minutes after the administration of barbital (150 mg/Kg, i.v.), the mice were treated with the product of the study at an initial dose of 100 mg/Kg (i.p.). For the most active products a dosage efficacy 50 (DE<sub>50</sub>) was determined. The results for some of the products of the invention are shown in Table 2, taking meprobamate as the reference product.

15 General anaesthetic activity

[0042] The general anaesthetic activity was study in mice, injecting the product of the study in the caudal vein. The start and duration time of sleep were recorded. The results for some of the products of the patent are shown in Table 3 and it can be seen that they show a clear anaesthetic activity with respect to the reference compound (Propofol), with the animals recovering later.

Sedative activity

[0043] The sedative activity of some of the products on the locomotive activity of mice at different dosages has been studied. The technique described by T.G. Heffneren J. *Pharm. Exp. Ther.*, 1989, 251, 105-112 has been followed. The measurement of the locomotive activity is carried out by dividing the rats into groups of four and determining the movement of the animals in an automated fashion using a video installation and the SMART program (Letica S.A.) for image analysis. The measurement of activity started 5 minutes after the administration of the product via i.p. and continued for twenty minutes. The results (Figure 1) show the sedative effect of the compounds tested.

Muscular relaxant activity

[0044] The muscular relaxant activity has been studied in the products of the invention by evaluated their effect on the abdominal body tone of mice, following the method described by S. IRWING (Gordon Res. Conf. On Medicinal Chem., 1959, p. 133).

[0045] The mice received the products under study at a dosage of 80 mg/kg, via i.p., and at different times after administration (1/2, 1, 2, 3, 4 and 5 hours) the body tone and the abdominal tone was evaluated looking at the muscular tension compared to the control animals.

[0046] The results listed in Table 4 show that many of the products are noticeably active as muscular relaxants. This effect lasts longer than for propofol or zolpidem, which were used as reference products.

Analgesic activity

**[0047]** The analgesic activity of the products of the invention have been studied by evaluation of their effect in the test of contortions induced by phenylbenzoquinone in mice, following the method described by Siegmund E., and coworkers (Proc. Soc. Exp. Biol. Med. 1957, 95: 729-731).

**[0048]** The mice received the products of the study, a different dosage levels, and one hour later they received an injections i.p. of 5 mg/kg of phenylbenzoquinone. The contortions of the mice were registered for the following fifteen minutes and compared with the contortions of the control group. The DE<sub>50</sub> (dosage efficacy 50) of the compound of Example 4 is shown. This compound showed a better analgesic activity than aspirin, both when administered subcutaneously and orally.
